

Granuform

Calcium Sulfate

$0+0+0+3MgO+30CaO+40SO_3$

Better turf starts below the surface

A soil-focused solution in development. Designed to improve rootzone conditions, support soil structure, and create the foundation for stronger, more resilient turf.

Recommended average dosage:

Sportfields: 10-40 g/m²

Golf green: 10-40 g/m²

Fine size: 0.5–1.5 mm

Improves soil structure

pH neutral

Enhances air movement in the soil

Helps reduce excess sodium and magnesium

Supports nutriënt efficiency

Supports healthy rootzone conditions

About this development

Going beyond nutrition to address real soil challenges

In practice, many turf problems are not caused by nutrition alone; compaction, limited air exchange, excess sodium or magnesium, and poor rootzone conditions all play a role. That is why we are developing this product as a dedicated soil solution for professional turf managers. With a focus on improving rootzone performance and overall soil health, this product is designed to be a practical, integrated tool for maintaining high-performance surfaces such as sports fields, golf courses, and other intensively managed green areas.

Join the field trial

Be part of shaping this product

We are currently running field trials with a select group of distribution partners. Your involvement helps us refine the product for the market, and gives you early insight into a solution designed with real field challenges in mind.

- Trial material supplied by Mivena at no cost
- Full feedback report shared with you after the trial period
- Direct input into the final product development
